

ABSTRACT OF THE DISCLOSURE

A spacer for applying a corrugated metal panel atop a roof covered by a number of rows of shingles. The spacer includes a strip of resilient foam having a width sufficient to rest flush against the exposed portion of one of the rows of shingles without overlapping adjacent rows and having a height sufficient to project above the tops of the shingles in adjacent rows. In use, a pair of spacers are positioned along two rows of shingles. Then, a corrugated metal panel is positioned atop the pair of spacers and is attached to the roof by means of a penetrating fastener.
